Hyprland

An independent Wayland compositor: automatic tiling, beautiful effects, config that reloads on save.

Hyprland (BSD-3-Clause, from hyprwm) is a dynamic tiling Wayland compositor that calls itself fully independent (no wlroots, libweston, kwin or mutter): effects, bezier and spring animations, plugins, IPC over a socket, several layouts (dwindle, master, monocle, scrolling) and config that reloads on save.

How it works in six steps

1. **Tile the windows** — dwindle, master, scrolling
2. **Set your own rules** — window, monitor, layer
3. **Effects and animation** — bezier, spring, blur
4. **Config reloads at once** — save and it applies
5. **Extend with plugins** — a built-in plugin manager
6. **IPC over a socket** — scripts can control it

Quick start

```
# Ubuntu (universe repo)
sudo add-apt-repository universe
sudo apt update && sudo apt install hyprland

# Alpine
apk add hyprland

# Solus
sudo eopkg install hyprland

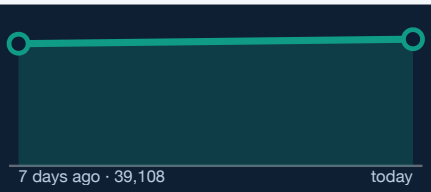

# Other distros
wiki.hypr.land → Getting Started → Installation

# Needs: Linux (or a similar system) with a Wayland-capable GPU; building needs a C++26 compiler (gcc 16+ or clang 19+)
```

Key commands / features

- **`sudo apt install hyprland`** — Ubuntu, universe repo
- **`apk add hyprland`** — Alpine
- **`sudo eopkg install hyprland`** — Solus
- **`wiki.hypr.land`** — configuration and install guides
- **`hyprpm (plugin manager)`** — may be packaged separately on some distros

Growth

Two real points: the start of the window and today, axis from zero. The gain is as reported by GitHub Trending; we did not rebuild the star history.

Why this repo exists

- A Linux desktop that is both beautiful and deeply customizable, without depending on someone else's base library.
- Config reloads on save for quick experiments; plugins and IPC allow extension with scripts.

What to use it for

- Tile windows automatically in several layouts
- Tune effects and animations
- Write plugins or scripts through IPC
- Set your own rules for windows and monitors

Think twice before you use it

- README: the authors are not afraid to ship bleeding-edge features: follow the release notes.
- Building needs a C++26 compiler (gcc 16+ or clang 19+).
- It is a Wayland compositor: try it on a spare account or machine first.
- Install commands come from the wiki Installation page on Nov 9, 2026; other distros differ.
