KIEU STUDIO · ONE-PAGE CHEAT SHEET · GITHUB RADAR

cloudflare/security-audit-skill

EPISODE 1 · How many of the AI's findings are real?

52,530	+28,617	+16,002	3,365	MIT	2026-06-18
TOTAL STARS	30-DAY GAIN	7-DAY GAIN	FORKS	LICENSE	CREATED

WHAT IT IS

Cloudflare's skill for AI agents hunting security vulnerabilities: one agent hunts, another only tries to disprove.

WHY IT EXISTS

A model that grades its own findings is marking its own exam. Splitting the roles makes the result easier to trust.

HOW IT WORKS

🗺️ **Recon**
architecture · boundaries

🔎 **Hunt**
separate hunters

🛡️ **Verify**
tries to disprove

📄 **Data**
findings + schema

👁️ **Re-check**
independent agent

✅ **Report**
from approved records

QUICK START

```
npx skills add https://github.com/cloudflare/security-audit-skill \
  --skill security-audit

# in the agent, at the source folder
> security audit this codebase
```

No sandbox → stays needs_validation, target code is not run. Needs: an agent with tool use and parallel sub-agents · Node.js · an OS-enforced sandbox.

GAINS

+ Schema-backed data
+ Reruns add up
+ See what was covered

COST

– Token cost
– Needs a sandbox

> **Think twice:** token-hungry, needs a sandbox, scan only code you are allowed to test.

TRY IT

🚀 **Before a release**
read the needs_validation list

📦 **An unfamiliar library**
try it in a sandbox

👥 **Two-team exercise**
hunters vs reviewers

📖 **Review checklist**
reuse the attack classes
