WHAT IT IS

A memory plugin for Claude Code: records sessions into local SQLite and recalls them in the next session.

WHY IT EXISTS

Session ends, context vanishes, and the agent starts blank. Progressive disclosure recalls a lot without burning tokens.

HOW IT WORKS

Lifecycle hooks
6 session events

Local worker
HTTP API · Bun

SQLite
sessions · observations · summaries

Chroma
keyword + semantic

search
compact index

get_observations
details, filtered ids only

QUICK START

```
npx claude-mem install

# or in Claude Code
/plugin marketplace add thedotmack/claude-mem
/plugin install claude-mem

# skip the sign-in
CLAUDE_MEM_ONLINE_OPTIN=false npx claude-mem install
```

Restart Claude Code → context from earlier sessions appears. Needs Node.js 20+. The installer may offer a sign-in; you can skip it.

GAINS

+ Continuity between sessions
+ Natural-language recall
+ Tokens on demand

COST

– Records activity
– Check where data lives

Think twice: hooks record tool activity — check what is stored, where, and whether it syncs to the cloud.

TRY IT

Decision log
why we chose this way

Memory for a content series
naming · style

Review debug history
where do I go wrong

Pair with a security skill
remember handled findings
