KIEU STUDIO · GITHUB RADAR · EPISODE 7 · CHEAT SHEET

superpowers

A complete software development methodology for coding agents.

A set of composable skills plus starter instructions so your agent asks questions, designs, plans, writes tests first, works through subagents and reviews, instead of diving into code. Skills trigger on their own: the agent checks for relevant skills before every task.

How it works in six steps

1. **Brainstorming** — ask questions, settle the design
2. **Own branch** — git worktree, clean test baseline
3. **Plan** — small 2-5 minute tasks with file paths and checks
4. **Subagents** — a fresh agent per task, review after each
5. **Tests first (TDD)** — red → minimal code → green → commit
6. **Finish** — verify tests; merge, PR or discard

Quick start

```
# Claude Code (official marketplace)
/plugin install superpowers@claude-plugins-official

# Claude Code (author's marketplace)
/plugin marketplace add obra/superpowers-marketplace
/plugin install superpowers@superpowers-marketplace

# Antigravity
agy plugin install https://github.com/obra/superpowers

# After installing
Nothing else to do: start building something and the sk
ills trigger

# Needs: Install separately for each agent tool you use
```

Example prompt: (illustration) Add a login feature to the app. → the agent asks you first, presents the design in chunks, then plans.

Key commands / features

- **`test-driven-development`** — red-green-refactor loop
- **`systematic-debugging`** — 4-phase root-cause process
- **`verification-before-completion`** — make sure it is actually fixed
- **`brainstorming`** — clarify intent before building
- **`writing-plans / executing-plans`** — detailed plans; run them in one context

Growth

Two real points: the start of the window and today, axis from zero. The gain is as reported by GitHub Trending; we did not rebuild the star history.

Why this repo exists

- Agents run on instinct: get a request, write code. No clarifying questions, no plan, tests later.
- Superpowers makes stopping to ask and plan a mandatory habit.

What to use it for

- New features that need design before code
- Hard bugs: systematic debugging
- Long runs with parallel subagents
- Learn TDD and review habits through your own agent

Think twice before you use it

- The process is mandatory, not a suggestion: it starts slower than typing a request and writing code at once.
- Subagent mode is the most thorough and costs more model calls than inline execution (README).
- Optional telemetry: a logo on the visual companion loads from the authors' site with the version number; disable with SUPERPOWERS_DISABLE_TELEMETRY (it also honors Claude Code's DISABLE_TELEMETRY).
- "The agent can work a couple of hours without deviating from the plan" is the author's own claim; Kieu Studio has not verified it.

Tried it? Kieu Studio has not run this tool.
