agent-browser

A browser for AI agents: read the page as a tree, act one command at a time.

agent-browser (Apache-2.0) is a native Rust CLI that lets an agent drive a browser one command at a time: snapshot returns the page as compact text with a reference like @e1 for each element; the agent clicks, fills, then reads again to check. Skill and MCP server included; runs on macOS, Linux and Windows.

How it works in six steps

1. **A background daemon** — starts on the first command
2. **The snapshot command** — page as tree, refs @e1
3. **Act by reference** — click, fill, type
4. **Read again to check** — fresh snapshot after change
5. **Safety limits** — domains, action policies
6. **Drives Chrome** over the DevTools protocol

Quick start

```
# Install (npm)
npm install -g agent-browser

# Download the browser (once)
agent-browser install

# Open a page and snapshot
agent-browser open example.com
agent-browser snapshot -i

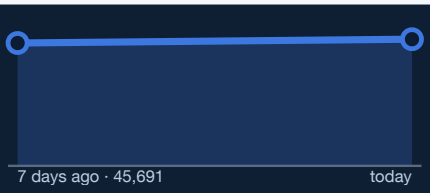

# Click by reference
agent-browser click @e1

# Needs: Node.js (npm) or Homebrew; Chrome for Testing is downloaded by the install command
```

Key commands / features

- `agent-browser open <url>` — open a page
- `agent-browser snapshot -i` — list interactive elements with references
- `agent-browser click @e1` — click by reference
- `agent-browser get url` — check the result
- `agent-browser mcp` — run the MCP server over stdio

Growth

Two real points: the start of the window and today, axis from zero. The gain is as reported by GitHub Trending; we did not rebuild the star history.

Why this repo exists

- An agent needs to see the page and act on it without reading a whole HTML page.
- A compact tree with references and a browser that stays open between commands: each step is one short shell command.

What to use it for

- Let an agent fill forms and act on the web
- Test a UI with short commands
- Take screenshots and replay a session
- Plug into apps that support MCP

Think twice before you use it

- The agent drives a real browser and can click, fill and download files for you: limit domains and actions (see the Security docs).
- References are valid only for that snapshot: snapshot again after the page changes.
- The first time, run agent-browser install to download Chrome for Testing.
- At first, use test accounts only with the sign-in session features.
